

Serenity Demo Initial Set Up

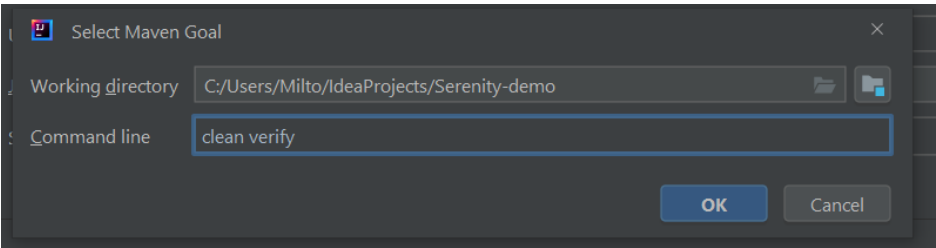

1. Download the project: <https://github.com/Milton-Agudelo/Serenity-demo>, there are two branches: 'main' and 'screenplay', this last have a more arranged project structure according to the screenplay pattern.
2. Open it as maven project.
3. Update and install required plugins, keep in mind that the project was configured with java 14, other versions might have unexpected behavior during build process.
4. Open file: `src/test/resources/features/count/analyze_text_composition.feature`, and run the feature:

5. Enable "Lombok processing" when the pop-up prompts to do so:
6. Edit Run/Debug Configurations as in the image below:

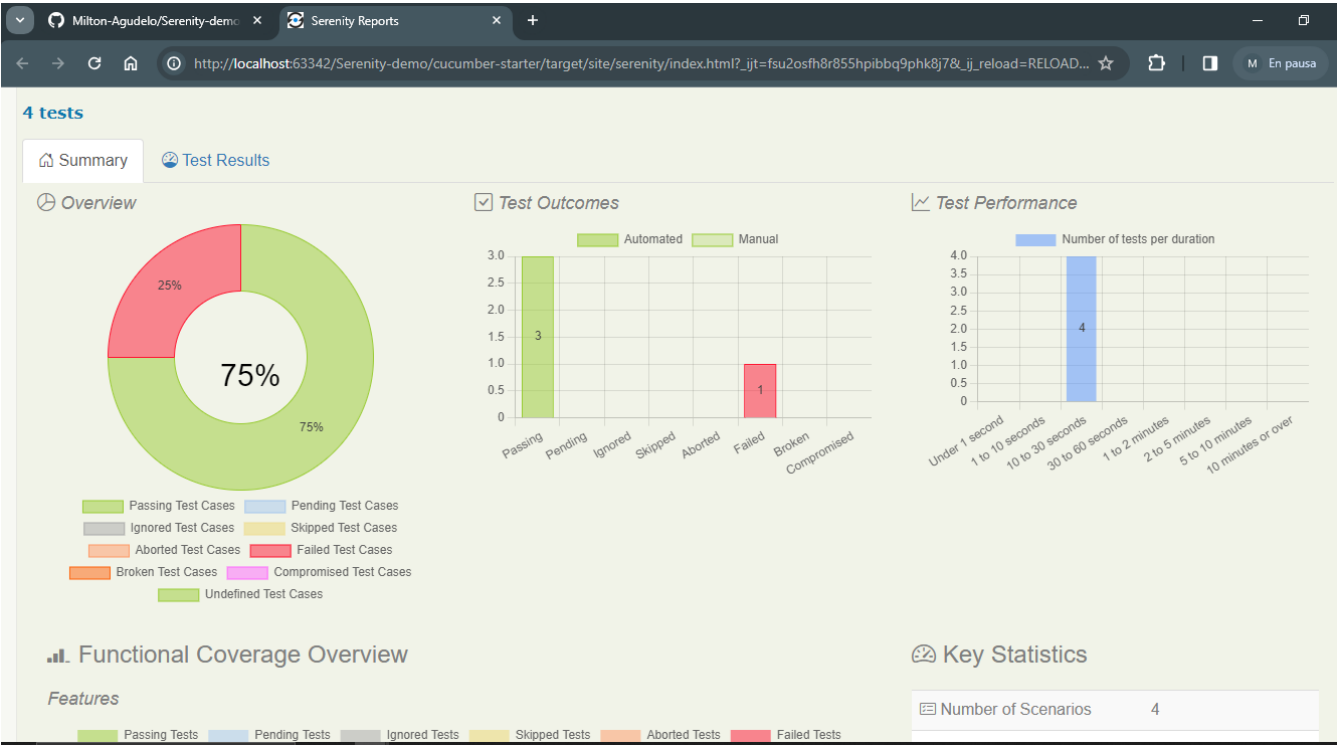

7. In the last down part of this configuration, edit "Before launch", deleting build and adding a Maven Goal:

8. Run the feature again.

9. Find the file: ../target/site/serenity/index.html, and open it with a browser (chrome, firefox, edge). You should be able to see the report like this:

</
